

**BSR/ASHRAE/IES Addendum dq  
to ANSI/ASHRAE/IES Standard 90.1-2022**

**Public Review Draft**

# **Proposed Addendum dq to Standard 90.1-2022, Energy Standard for Sites and Buildings Except Low- Rise Residential Buildings**

**First Public Review (August 2025)  
(Draft Shows Proposed Changes to Current Standard)**

This draft has been recommended for public review by the responsible project committee. To submit a comment on this proposed standard, go to the ASHRAE website at [www.ashrae.org/standards-research--technology/public-review-drafts](http://www.ashrae.org/standards-research--technology/public-review-drafts) and access the online comment database. The draft is subject to modification until it is approved for publication by the Board of Directors and ANSI. Until this time, the current edition of the standard (as modified by any published addenda on the ASHRAE website) remains in effect. The current edition of any standard may be purchased from the ASHRAE Online Store at [www.ashrae.org/bookstore](http://www.ashrae.org/bookstore) or by calling 404-636-8400 or 1-800-727-4723 (for orders in the U.S. or Canada).

This standard is under continuous maintenance. To propose a change to the current standard, use the change submittal form available on the ASHRAE website, [www.ashrae.org](http://www.ashrae.org).

The appearance of any technical data or editorial material in this public review document does not constitute endorsement, warranty, or guaranty by ASHRAE of any product, service, process, procedure, or design, and ASHRAE expressly disclaims such.

(This foreword is not part of this standard. It is merely informative and does not contain requirements necessary for conformance to the standard. It has not been processed according to the ANSI requirements for a standard and may contain material that has not been subject to public review or a consensus process. Unresolved objectors on informative material are not offered the right to appeal at ASHRAE or ANSI.)

FOREWORD

This addendum updates lighting modeling rules in Section 12 and Appendix G to align with the current prescriptive requirements in Section 9. The dwelling units LPD is based on PNNL’s [90.1 2022 Final Determination Technical Support Document](#) reflect 90.1 2019 Addendum br. Updates to Section 12.5.2 clarifies that systems and components in the proposed design that do not meet prescriptive requirements in Section 6 must be modeled as minimally compliant with this section unless otherwise prescribed in Figure 12.5.2 and Table 12.5.2-1.

*[Note to Reviewers: This addendum makes proposed changes to the current standard. These changes are indicated in the text by underlining (for additions) and ~~striketrough~~ (for deletions) except where the reviewer instructions specifically describe some other means of showing the changes. Only these changes to the current standard are open for review and comment at this time. Additional material is provided for context only and is not open for comment except as it relates to the proposed changes.]*

Addendum dq to 90.1-2022

**12.5.2 HVAC Systems.** The HVAC system type and related performance parameters for the *budget build- ing design* shall be determined from Figure 12.5.2, the system descriptions in Table 12.5.2-1 and accompa- nying notes, and the following rules:

- a. ~~Budget Building Systems Parameters~~ **Not Listed.** Where there are ~~specific~~ requirements in Sections 6.4 and 6.5 applicable to systems and components in the budget building design, the budget building design shall be modeled as meeting these requirements. ~~Budget design~~ ~~Components and parameters not listed in Figure 12.5.2 and Table 12.5.2-1 or otherwise~~ not specifically addressed in this subsection shall be identical to those in the *proposed design*.

~~**Exception to 12.5.2(a):** Where there are specific requirements in Sections 6.4 and 6.5, the component efficiency in the budget building design shall be adjusted to the lowest efficiency level allowed by the requirement for that component type.~~

.....

Proposed Design (Column A) Design Energy Cost (DEC)	Budget Building Design (Column B) Energy Cost Budget (ECB)
<b>6. Lighting</b>	
Lighting power in the <i>proposed design</i> shall be determined as follows:  .....  d. <i>Lighting system</i> power shall include all <i>lighting system</i> components shown or provided for on plans (including <i>lamps</i> , <i>ballasts</i> , <i>task fixtures</i> , and <i>furniture-mounted fixtures</i> ). For <i>dwelling units</i> , hotel/motel guest rooms, and other <i>spaces</i> in which <i>lighting systems</i> consist of plug-in light fixtures that are not shown or provided for on <i>design documents</i> , assume identical	a. Where a complete <i>lighting system</i> exists, lighting power in the <i>budget building design</i> shall be the same as in the <i>proposed design</i> .  b. Where a <i>lighting system</i> has been designed, the <i>interior lighting power allowance</i> shall be determined using either the <i>Building Area Method</i> or <i>Space-by-Space Method</i> , and the <i>space</i> use classification shall be the same as the <i>proposed design</i> with lighting power set equal to the maximum allowed for the

<p>lighting power for the <i>proposed design</i> and <i>baseline building design</i> in the simulations.</p> <p>....</p> <p>f. Automatic daylighting controls included in the <i>proposed design</i> may be modeled directly in the <i>building simulation</i> or be modeled in the <i>building simulation</i> through schedule adjustments determined by a separate analysis approved by the <i>authority having jurisdiction</i>. Modeling and schedule adjustments shall separately account for <i>primary sidelighted areas</i>, <i>secondary sidelighted areas</i>, and toplighted areas <u>and shall account for fenestration VT</u>.</p> <p>g. Automatic lighting controls included in the <i>proposed design</i> but not required by Section 9.4.1 shall be modeled using the following methods for each luminaire under control:</p> <ol style="list-style-type: none"> <li>1. Manual-on or partial-auto-on <i>occupancy sensors</i> shall be modeled by reducing the lighting schedule each hour by the <i>occupancy sensor</i> reduction factors in Table G3.7-1 and G3.7-2 for the applicable <i>space</i> type multiplied by 0.25.</li> <li><del>2. Automatic lighting controls listed in Table 9.5.2.3 shall be modeled using the sum of the applicable control factors (CF). Apply control factors to only the portion of wattage of the fixtures in the space controlled by said lighting control. Divide each hour of the lighting schedule by <math>(1 + \sum CF)</math>, where <math>\sum CF</math> indicates the sum of all applicable control factors for that space per Section 9.5.2.3 and Table 9.5.2.3.</del></li> </ol> <p>.....</p>	<p>corresponding method and category in Section <u>9.5.9.2</u>. <del>Additional interior lighting power for nonmandatory controls allowed under Table 9.5.2.3 shall not be included in the budget building design.</del> Lighting power density in dwelling units shall be <del>0.60</del> 0.29 W/ft<sup>2</sup> (<del>6.5</del> 3.1 W/m<sup>2</sup>)</p> <p>c. Where lighting neither exists nor is submitted with design documents, the lighting power in the <i>budget building design</i> shall be the same as in the <i>proposed design</i>.</p> <p>d. Power for <i>fixtures</i> not included in the lighting power calculation shall be modeled identically in the <i>proposed design</i> and <i>budget building design</i>.</p> <p>e. Mandatory <i>automatic</i> lighting controls required by Section 9.4.1 shall be modeled the same as the <i>proposed design</i>.</p> <p><u>f. Modelling of daylighting controls shall account for fenestration VT</u></p>

Table G3.1 Modeling Requirements for Calculating Proposed Building Performance and Baseline Building Performance (Continued)

Proposed Building Performance	Baseline Building Performance
<p>6. Lighting</p> <p>Lighting power in the <i>proposed design</i> shall be determined as follows:</p> <p>.....</p> <p>e. For <i>dwelling units</i>, hotel/motel guest rooms, and other <i>spaces</i> in which <i>lighting systems</i> are connected via receptacles and are not shown on <i>design documents</i>, lighting power used in the simulation shall be equal to the lighting power allowance in Tables 9.5.2.1-1 and 9.5.2.1-2 for the appropriate <i>space</i> type or as designed, whichever is greater. For the <i>dwelling units</i>, lighting power used in the simulation shall be equal to <del>0.60</del> 0.29 W/ft<sup>2</sup> (<del>6.5</del> 3.1 W/m<sup>2</sup>) or as designed, whichever is greater.</p> <p><b>Exception:</b> Lighting use can be reduced for the portion of the <i>space</i> illuminated by the specified <i>fixtures</i> provided that they maintain the same illuminance level as in the baseline. Such reduction shall be demonstrated by calculations.</p>
